To ensure the maximum life of a NiCad battery pack, there are some guidelines which must be followed as general maintenance.

- Batteries perform best if charged at room temperatures. Do not charge in temperatures below 40°F or above 105°F. Under these conditions, the battery will not take a full charge and may be permanently damaged. Store the battery in a cool, dry place. Temperatures exceeding 120°F may reduce the battery life.
- If the battery is hot, let it sit out of the charger for a least 2 hours until it is at room temperature.
- Do not try to discharge the battery beyond the point where the tool no longer performs with the power and torque needed for the job, this cause permanent damage which will prevent the battery from taking a full charge.
- Periodically charge the battery overnight to take full advantage of the 3-Stage Charging System for optimum runtime and battery life.
